

This document is meant a checklist for students to self-assess their reports before submission, and as a guideline for reviewers when grading the submissions.

General Grading Rules

This assignment has a maximum of 100 points. The letter grade is determined as follows:

A	B	C	D	E	F
≥ 90	≥ 80	≥ 70	≥ 65	≥ 65	< 60

Points are awarded for individual sections of the submitted report (see “Specific Grading Criteria” section below). Points are deducted for general issues, and there are sanctions for serious misconduct (“Further Requirements and Possible Sanctions”). There are no bonus points.

Specific Grading Criteria for Section 1 (16 points)

1.1 System Description & History (5 points)

- Description of the main purpose and characterization of users/user groups: **2P**
- Link to source code: **1P**
- Project age, size, contributor count, activity curve: $4 \times 0.5 =$ **2P**

1.2 Quality Attributes (6 points)

- Precise definition of each attribute: $3 \times 1 =$ **3P**
- Reasonable discussion of importance of Modifiability in relation to system/system structure: **1P**
- Reasonable discussion of importance of Testability in relation to system/system structure: **1P**
- Reasonable selection and rationale of third attribute for relation to system/system structure: **1P**

1.3 System Structure & Architecture Decisions (5 points)

- Decomposition View, with module relationships if they make sense: **2P**
- View for design decision for third quality attribute (or explanation if there is none): **2P**
- Description of how design decisions were identified: **1P**

Specific Grading Criteria for Section 2, 3, and 4 (27 points each)

Subsection 1 – Metrics (9 points)

- For each metric (3×):
 - Definition and description: **1P**
 - Argument for connection between metric and quality attribute: **1P**
 - Discussion of metric limitation: **1P**

Subsection 2 – Measurements (9 points)

- For each metric (3×):

- Description of data collection (how the measurement was obtained, including the tool or method used, the analyzed source-code version or time span, and any relevant configuration or processing steps): **1P**
- Traceable data and analysis artifacts in the repository (relevant raw or extracted data and any scripts, configurations, or processing artifacts used for the measurement): **1P**
- Appropriate presentation of collected data (e.g. as a table, as a figure, etc.): **1P**

Subsection 3 – Discussion (9 points)

- Summary of the individual measurements: **2P**
- Critical reflection of limitations, consideration of any conflicting data, etc.: **3P**
- Discussion in relation to identified architecture decisions, incl. assessment of problem cause: **4P**

Data Availability and Reproducibility (3 points)

- Public repository URL and exact commit ID are included in the report, commit is accessible: **1P**
 - Collected raw data and relevant intermediate data included and correspond to the reported measurements: **1P**
 - Scripts, configurations, and documentation necessary to understand and (within reason) reproduce the data collection and analysis: **1P**
-

Further Requirements and Possible Sanctions

A. Consistent Formatting

We expect a consistent formatting style throughout your report, e.g., font, margins, numbering of sections, tables, and figures, etc.

Possible Consequences:

- Reports that considerably deviate from the required structure: **-5P**
- Bad formatting that impedes our ability to understand and assess the report: **-10P**

B. Coherent Reports

Student groups may split the writing efforts across the different sections, but still need to coordinate to deliver a consistent report and understand every part of it.

Possible Consequences:

- Logical inconsistencies, e.g., decisions in Part 2 that are not motivated by drivers in Part 1: **-5P**.
- We may call for an oral follow-up to discern how much each group member understood the design context and the architectural decisions made. Negative outcomes result in lower grades for individuals compared to the rest of the group, or even a failing grade.

C. Fair Contributions

We expect all group members to contribute to the overall effort with comparable effort.

Possible Consequences:

- We may call for an oral follow-up to discern whether how each group member contributed. Negative outcomes result in lower grades for individuals compared to the rest of the group, or even a failing grade.

D. No Plagiarism

We expect students to properly cite and credit any material used in your report. Check out the [Refero project](#) if you are unsure about how to do this.

Possible Consequences:

- We may call for an oral follow-up to discern the extent of intentional or unintentional plagiarism. Negative outcomes result in a failing grade and a report to BTH's disciplinary committee.

E. Responsible Use of AI

We expect students to use any AI tools responsibly. The goal of this assignment is not to deliver an *artifact* (the report), but to have gone through the thought *process* of analyzing the design context and making design decisions of which the report is only a documentation.

Refer to the course's [GenAI Policy](#) for details, in particular Section 2.2 *Human Analysis and Decision-Making*, 2.3 *Human Authorship*, and 3.1 *Mandatory Disclosure*. Make use of the offered Q&A slots with the examiner if you are unsure how to use AI and/or report on it.

Possible Consequences:

- We may call for an oral follow-up to discern whether each group member actually attained the learning goal. Negative outcomes result in a failing grade and a report to BTH's Disciplinary Board.
